1.1.1 Functions

`ReplaceField(field_code1, field_code2)`

This function is a method associated with structures used in the state diagrams. This method replaces the value of a field in the structure, specified by `field_code1`, with the value from the field specified by `field_code2`. The `field_code1` and `field_code2` parameters are one of the Field Code values specified in Table 6-2.
