## 1.1 Transmit path specification

**Editorial note:** This is clause

### 1.1.1 Principles of operation

The transmit path of the VLC sublayer includes the Transmit process. The Transmit process waits for [assertion of the VLCSI:MA\\_DATA.request, VLCSI:VLCPPDU.request, or VLCSI:OMCI.request primitives](#).

[Upon assertion of the VLCSI:VLCPPDU.request primitive, the received parameters are encapsulated into a VLCPPDU with subtype VLC\\_CONFIG \(see \*\*Error! Reference source not found.\*\*\) according to the format defined in 8.1.1. Conceptually, this action takes place in the VLC Interface adapter as shown in Figure 6-1. Note that both the MAC destination address and the MAC source address are equal to the local MAC address assigned to the port to which the VLC sublayer is associated. The resulting VLCPPDU is supplied to the egress CTE.](#)

[Upon assertion of the VLCSI:OMCI.request primitive, the received parameters are encapsulated into a VLCPPDU with subtype OMCI\\_SUBTYPE \(see \*\*Error! Reference source not found.\*\*\) according to the format defined in 5.2.3. Conceptually, this action takes place in the OMCI Interface adapter as shown in Figure 6-1. Note that both the MAC destination address and the MAC source address are equal to the local MAC address assigned to the port to which the VLC sublayer is associated. The resulting VLCPPDU is supplied to the egress CTE.](#)

[Upon assertion of the VLCSI:MA\\_DATA.request primitive, the received parameters are supplied to the egress CTE.](#)

After the above processes are complete, the resulting xPDU is processed by the Egress Classification and Translation Engine (CTE). If a match is found, the frame is modified according to the matched rule's action. If the frame does not match any rules, it is passed through the CTE block unmodified.

Note that to enter a tunnel, the VLC xPDU or the OMCI xPDU require a matching egress CTE rule that, at a minimum, overwrites the local MAC address value in the VLCPPDU destination address field with the MAC address associated with the xPDU destination for the given tunnel.

### 1.1.2 Constants

The constants referenced in this state diagram are defined in **Error! Reference source not found.**

### 1.1.3 Variables

EgressRuleId

TYPE: 16-bit unsigned integer

This variable identifies one of the provisioned CTE egress rules. It also may have a special value none that does not identify any of the provisioned rules.

MaDataTxInput

TYPE: structure

This variable contains the set of parameters of the VLCSI:MA\_DATA.request() primitive as defined in 4.3.1.1.1.

**Deleted:** an xPDU to be received from one of the VLCSI interfaces: (VLCSI:MA\_DATA, VLCSI:VLCPPDU, or VLCSI:OMCI).

**Deleted:** If an VLC xPDU is received from the VLCSI:VLCPPDU interface, it

**Deleted:** is converted

**Deleted:** Table 5-1

**Deleted:** by prepending a VLCPPDU header to the VLC xPDU payload

**Formatted:** Highlight

**Deleted:** The header consists of the destination address, source address, and Ethertype fields.

**Deleted:** s

**Deleted:** 6.2.2

**Deleted:** Pdu

**Deleted:** TYPE: structure containing an Ethernet frame

1 [VlcCfgTxInput](#)  
2     **TYPE:** structure  
3     This variable contains the set of parameters of the VLCSI:VLC PDU.request() primitive as defined  
4     in 4.3.1.2.1.

5 [OmciTxInput](#)  
6     **TYPE:** structure  
7     This variable contains the set of parameters of the VLCSI:OMCI.request() primitive as defined in  
8     4.3.1.3.1.

9 [TxInputPdu](#)  
10    **TYPE:** structure  
11    This variable holds an Ethernet frame to be passed to the CTE. The fields of this structure correspond  
12    to the parameters of the MA\_DATA.request() primitive, as defined in IEEE Std 802.3, 2.3.1. It  
13    is formed as the result of receiving input from the VLCSI:OMCI.request(),  
14    VLCSI:VLC PDU.request(), or VLCSI:MA\_DATA.request() primitives and is passed as the input to  
15    the CTE.

16    The TxInputPdu structure supports the AddField(field code, field value) method.  
17    The field\_code parameter takes values as defined in [Error! Reference source not found.](#)

18 [TxOutputPdu](#)  
19    **TYPE:** structure  
20    This variable holds an Ethernet frame to be passed to the MACCSI:MA\_DATA interface. The fields  
21    of this structure correspond to the parameters of the MA\_DATA.request() primitive, as defined  
22    in IEEE Std 802.3, 2.3.1.

23 **1.1.4 Functions**

24 CheckEgressRules(input\_pdu)  
25    This function returns the identification of one and only one egress rule that matches the frame  
26    contained in the input\_pdu structure. It is out of the scope of this standard to specify how this  
27    function chooses its return value if multiple rules match the frame. If none of the rules matches the  
28    frame, a special value, none, is returned

29 Modify(rule\_id, input\_pdu)  
30    This functions is defined in [Error! Reference source not found.](#)

31 [Concat\(value1, value2, ..., valueN\)](#)  
32    This function returns the concatenation of the input parameters. The input parameters are  
33    concatenated in the order they appear in the function call.

34 **1.1.5 Primitives**

35 The primitives referenced in this state diagram are defined in [Error! Reference source not found.](#)

36 **1.1.6 State Diagram**

37 VLC sublayer shall implement the Transmit process as defined in the state diagram in [Figure Error! No text  
38 of specified style in document.-1.](#)

**Deleted:** ¶  
This variable holds a PDU received from one of the VLCSI interfaces (VLCSI:VLC PDU, VLCSI:OMCI, or VLCSI:MA\_DATA). When received from the VLCSI:MA\_DATA interface, the TxInputPdu structure contains a complete and properly-formed Ethernet frame. When received from VLCSI:VLC PDU or VLCSI:OMCI interfaces, the TxInputPdu structure contains a partial frame, that only includes the parameters defined for the respective request() primitive (see ¶4).

**Deleted:** Additionally, the

**Deleted:** , which adds a field identified by the field\_code and having the value field\_value to the structure.

**Deleted:** Table 6-2

**Deleted:** containing an Ethernet frame¶

**Deleted:** A CTE egress rule is considered misconfigured if applying this rule to the TxInputPdu results in a malformed Ethernet frame being stored in the TxOutputPdu structure.

**Deleted:** This function returns the identification of an egress rule that matched the the frame contained in TxInputPdu structure. If multiple rules matched the frame, the function returns an identification of any of these rules. If none of the rules matched the frame, a special value none is returned.
